PROFILE

Software engineer with internship experience at Ecobank and TotalEnergies. I build across the stack: Spring Boot and NestJS APIs on MySQL, React and React Native on the front end, Docker and Git for delivery. On my own time I build systems software, including a Java limit order book matching engine that benchmarks at roughly 1.4M orders per second, an x86-64 kernel in Rust, and an ERC-721 land registry. I am now moving into AI engineering and working with the OpenAI API and LangChain.

EXPERIENCE

Ecobank Transnational Incorporated, Software Engineering Intern (Backend)

Jul – Oct 2024

Lagos, Nigeria

- Built and maintained RESTful APIs in Java and Spring Boot, handling high volumes of requests in a regulated banking environment.
- Designed a normalized MySQL schema for core product features, which cut query complexity and protected data integrity.
- Optimized slow database queries and measurably reduced response latency.
- Worked with the front-end developers to agree API contracts, which cleared integration blockers and sped up delivery.
- Debugged and fixed production issues in a live, customer-facing system.

Bazara Tech, Product Intern

Jul – Sep 2025

Nigeria

- Tested and debugged APIs across several product features, catching issues early and contributing to more stable releases.
- Wrote technical documentation for APIs and internal processes, which reduced onboarding friction for new contributors.
- Sat in daily scrums and saw the full product cycle in a fast-moving B2B team, from scoping through sprint planning, QA and release.

Ecobank Transnational Incorporated, Software Engineering Intern (Frontend)

Aug – Sep 2023

Lagos, Nigeria

- Developed responsive web and mobile banking features in React and React Native on a platform serving over 1M active users.
- Built and deployed a containerized backend with NestJS and Docker, improving data availability and developer throughput.
- Wrote automated regression tests with React Component Testing, cutting manual QA effort and improving release reliability.

TotalEnergies, IT Intern

Aug – Sep 2022

Lagos, Nigeria

- Managed the IT ticketing system, resolving hardware and software incidents to keep operations running without downtime.
- Ran IT asset inventory and lifecycle tracking for 50+ devices, improving allocation accuracy and audit compliance.

PROJECTS

Source and live demos: github.com/Barizio and adebareadesokan.vercel.app

Matching Engine, Limit Order Book

Java 21

- A limit order book matching engine with strict price-time priority, integer-tick pricing and O(1) cancel.
- Wrote a benchmark harness that clocks it at roughly 1.4M orders per second. The point of the project was latency and correctness under load, the constraints that core banking and trading systems run on.

LandChain, Blockchain Property Registry

Solidity, React

- ERC-721 land titles with a two-gate security layer: a 3-of-3 multi-signature quorum plus a biometric identity hash, with off-chain storage on IPFS.
- The registry produces immutable ownership records and an audit trail, which is the same problem enterprises have with asset, contract and identity management.

AfaraAI, AI Cultural Heritage Platform

Winner, Google AI4Culture Hackathon

- Co-developed AI models for artifact recognition and translation of low-resource African languages.
- Owned the pitch and demo that won the hackathon and coordinated the team to deliver on deadline.

Rust Kernel and Bootloader

Rust, x86-64

- A freestanding x86-64 kernel built on the bootloader API crate, with hardware interrupt handling and a framebuffer text writer. It boots on bare metal with no standard library.

Shift Management System

Java

- Built for staff at my university to automate shift logging and tracking, replacing the paper logs they were keeping by hand.

Front-End Showcase: Aurora, MONOLITH, Atelier Vesper

HTML, CSS, JS

- Three live interactive sites built by hand, covering canvas gradient-mesh rendering, a live editable type specimen and orchestrated scroll reveals. No libraries and no build step.

TECHNICAL SKILLS

Backend: Java (Spring Boot), Node.js, NestJS, Python, RESTful API design

AI and Emerging Tech: OpenAI API, LangChain, applied ML (recognition and translation), Solidity

Frontend: TypeScript, ReactJS, React Native, Tailwind CSS, HTML, CSS, JS

Systems and Languages: Rust, C++, low-level systems programming

Databases and Tools: MySQL, PostgreSQL, SQL, Docker, Git, Postman

Ways of Working: Backend engineering, database design, automated testing, agile collaboration, technical documentation

EDUCATION AND AWARDS

Pan-Atlantic University, B.Sc. Computer Science

Oct 2022 – Dec 2026

Relevant coursework: Data Structures & Algorithms, Intro to Artificial Intelligence, Database Management, Principles of Software Engineering, Systems Analysis & Design, Compiler Construction, Digital Logic Design.

- Winner, Google AI4Culture Hackathon (Centenary Project Incentive)
- 2nd Place, TIC Hackathon. Led an MSME financial inclusion platform with cashflow tracking and automated credit score analysis.
- 5th Place, 2025 GBSN Africa Business Concept Challenge
- Peer-to-peer tutoring program organizer, Pan-Atlantic University, 2024 to present
